

# MeV v4.1.01 (bugfix) release

*April 2, 2008*

This is a minor bugfix release. The most major change to this release is that the Mac build works properly out of the box, and is provided in a bundled Mac OSX application folder. Other minor tweaks have also been included:

Mac application bundle is available

New shell script (tmev.sh) provides Java v1.5-compatibility.

Link to MeV manual now links to the MeV v4.1 version, rather than v4.0.

Downloading of annotation files automatically now works with Macs and Linux.

HCL dialog now has a metric menu.

Fixed launching of data subsets in a new window.

PCA status bar reports better reflect processing steps.

PCA default centering selection is set to 'median'.

Annotation link to JCVI is updated.
